## Ideal for **Rapid** Sanitizing of Nurse Station Countertops and All Non-Critical Items!

Our **UV DeskScan Console™** has been designed as a mobile UV disinfecting station for sanitizing countertops & non-critical hospital items that are known for harboring microbial pathogens. Hospitals should place this console at or near nurse stations in order to sanitize the many desk, pocket, medical and personal items belonging to hospital and medical staff.

Despite the growing awareness concerning the role of microorganisms existing for months on non-critical items and its implication in cross contamination, the need to clean and disinfect these surfaces and objects are rarely converted into practice. There is a definite need for formulating a proper place, surface, schedule and method for disinfecting non-critical products.

While some of these items have been recommended by the CDC to be sanitized between **each** and every patient examination (stethoscope diaphragm and blood pressure cuff), many others are required to be done on a daily basis (computer keyboards, writing instruments, manuals, clipboards, etc.).

Finally, there is a need for medical staff to disinfect many of their own personal items used during the day, so as not to take any pathogens home; such as mobile phones, iPads, pens and so much more. And the entire console is coated with our **TiO<sub>2</sub> Self Cleaning Surface Coating** that inhibits bacteria, viruses and mold from surviving on the unit.
