

## Independent Laboratory Testing

Several dozen of our customers have requested that we test one of our UVC sanitizers and determine if it is able to inactivate specific bacteria or viruses that they have concerns about for their country. Costs for these independent lab tests vary from \$1,000 to \$3,000.

Recently we were requested to test out Helix and see how long it took to destroy SARS and MERS (Severe acute respiratory syndrome and Middle East Respiratory Syndrome). It took two weeks to design the testing protocol along with help from the testing laboratory. We then sent the device they requested to use for the testing and the lab provided them with a precise and thorough testing report that they were able to provide to their interested parties. Please feel to call us should you wish more info.

Over the last 10 years we have found what we believe are the best independent testing labs for different types of testing that have been requested from our customers and ourselves.

Choosing the right microbiology testing laboratory is an important decision and we did that homework a long time ago.

You will have your dedicated Project Manager that can assist you with technical questions or project concerns. Highly trained, degreed analysts will perform all analyses and you will be able to speak with them during all the phases of your study.

In the end, you will receive a full report that is extremely detailed yet easy to understand. Our FDA certified labs provide testing services for environmental, biotechnology, healthcare, food industries and more.
